

Today I'll be talking about planes! ALL aircraft are good, right? That's what I thought, too. Turns out some are completely pointless/overcomplicated, and some are even figments of people's imaginations. Stop making random things up and get a proper job. Wait, no one wants to hire you! Ohhh!!! The pain is real. Intro over, let's go!

Aerobatic aircraft

An aircraft that's used in aerobatics. That makes perfect sense, but why is the fact the planes are lighter than air pointed out in Wikipedia? Think of ONE object that's lighter than air, I mean any object at all. It's implying many, most or maybe even all planes get airborne because of some kind of apparent antigravity effect. Come on. Have you seen a jumbo jet? They're massive and they're clearly made of metal! Metal lighter than air? Get away from me! Remember how Wikipedia used to ask for donations? Those requests seem to have stopped for me at least, and NOW look at the site. It's gone to the dogs.

Bush plane

A small plane designed to fly to remote areas such as the Canadian bush, the African bush, etc. That implies there is only one bush in the whole of Canada and the whole of Africa. I know for a fact that's wrong. You've screwed up again, Wiki! You mean 'bushes'!

Civil aircraft...

... are defined as 'All non-military and non-state aviation.' Does that mean you don't get such planes in the United States? Seems unfair, if not racist. Let's just make an assumption and call civil aircraft jumbo jets and that kind of stuff. (Because such planes are shown on Wiki). Come on, jumbo jets. Open your minds a little.

Extraterrestrial aircraft

Did you know there is a helicopter designed for flying on Mars?? Yes, there's nobody there, but it is a nice thought. Even better, I heard that people may be visiting the planet in the not too distant future, and if that wasn't exciting enough, you'll be able to hover above it!

Fictional aircraft

I'm surprised these 'kind of planes' were mentioned on Wiki, as they could be anything thought up by any old nutter. But let's give the page a try. Ok, they do look cool, but far from practical. I'd bet a lot of money their designs don't even serve any kind of purpose. Noobs!

Glider

If you thought flying in passenger aircrafts was scary enough, gliders don't even have engines!! I can barely think of a more terrifying thought for those who fear flying. :S In the right hands however, lots of fun I'm sure. But at least have a backup engine, no?

High-altitude and long endurance aircraft

Self-explanatory. Interestingly, Turkey has its own version of such an aircraft called the 'TAI Anka'. As we all know, turkeys (as in the animals) are the opposite - they're low altitude and low endurance flyers. I just thought that was funny. Oh, apparently turkeys can actually fly for quite a way. I was thinking of chickens. But there's no country called 'Chicken', sadly.

Jet trainer

Don't be tricked by the name, jet trainers don't train jets (you can't train a machine to fly, you program it), actually a jet trainer must be a kind of massive shoe. I don't understand either, believe me.

Liaison aircraft

Mini spy planes, basically. For whatever reason, all the ones I've seen on Google are very old fashioned. I guess that's not what the enemy would be expecting. Like a guy with a bow and arrow approaching a group of tanks. They'd be like 'He's not actually going to fire at us...' He does. Consequently, he dies, which is fitting as I'm assuming old aircraft are VERY easy to shoot down.

Model aircraft

I'm not saying model aircraft are pointless, but they are the most pointless aircraft on the list so far. Unless you want to give your pet hamster a well deserved holiday and an unforgettable experience.

Ornithopters

An aircraft that flies by flapping its wings!! What is the point of that?? Can they fly faster than the speed of sound? I doubt that very much. Can they hover as well as helicopters? Surely not. You just want to make a vehicle that just looks cool, don't you?

Parasite aircraft

Here's a real sentence I've found on Wikipedia 'If the bomber (aircraft) was threatened, the parasite (aircraft) would be released to defend it'. Do you even know what a parasite is? Parasites DO NOT help people.

Racing aircraft

These aircraft are fast of course, but I'm just saying there are some fighter aircraft that can go mach 3. You want to see a race with those things just as much as me.

Seaplanes

Planes that can land in the sea? Are you ABSOLUTELY sure? Because this is the

kind of thing you have to be completely certain about. It's just with the whacky plane shoes and all that stuff. Makes you wonder what's real.

Trainer aircraft

Aircraft in general that wear trainers. Trainers again??? Why??? What's wrong with wheels? Wheels work fine!

Unmanned aerial vehicles

Do paper airplanes qualify, I wonder? Just a thought. If so, wow, I've made an unmanned aerial vehicle. Sadly me making a manned aircraft is a big leap. :(

Vertical take off and landing aircraft

I've been thinking about these planes for a while and will have to admit defeat. I have no idea what to say. Other than I guess 'good idea'. Either that or build aircraft carriers with runways that are a mile long, which would be cool I guess, but boats that are so thin, relatively speaking? Wouldn't they like, fall over?

Ok, I'm finished! What have we learnt? Well, I'VE learnt that 'parasite' seems to have two meanings, and now if someone told me I was infected with such creatures, I wouldn't know how to react, which is very annoying. You on the other hand may have learnt nothing. :S But maybe you will next monologue. Who knows, right? Byeeee!
