

I heard that there are 2 types of people, type A and B. The former people are ambitious, the latter are more laidback. Even ant society is more complicated than that. You get the soldier ants who I guess can be described as type A, the worker ants who are more laid back relatively speaking at least, making them type B and the queen that fits into the previously unnamed category, that I call type C. That's three already, there are probably more. If people really are that simple, what must studying psychology at university be like? I imagine something like this: Question 1: How many types of people are there? (Answer: 2). Question 2: What are the names of the types? (Answer: A and B). Final question: What's the difference between the types? (Best answer: A difference in assertiveness and ambitiousness. Lower scoring answer: Not that much). God knows what the coursework for such a degree would be like. Maybe 'research what the difference between the letter A and B is.' Want to know how to ace the question? The difference between the two letters is the shape.

And God knows what the masters course of psychology is like. Taking things further, what the FLIP do doctors of psychology study? Maybe really advanced concepts such as the category C that I mentioned earlier. But even that isn't particularly complicated, category C in human psychology just refers to the people queen! Can it refer to the king as well? Who knows. In that case, maybe it is complicated. But surely you can't describe yourself as a doctor if you can solve the problem. Here's the kind of thing doctors of physics understand:  $E=MC^2$ , that means it's impossible to go faster than the speed of light, as you'd need an infinite amount of energy or whatever. How does such a concept relate to the letters and number? Haven't a clue, so how the hell did such simple people figure that out?? Maybe Einstein was an ant, there's a crazy theory for you. Maybe a mad ant scientist worked out how to genetically modify such an insect so it could work tools with human fingers, then all of a sudden, the power of ants is unleashed.

I'm wondering why it seems there has only ever been one ant in the form of a human. Well, maybe there isn't, maybe ants are running everything. You really think mankind can hold any power if it only consists of working people and lazy people? Sure working people can get things done, but not without direction and of course, no one apart from ants can give them direction as the rest of people can't be bothered. You know what I say? I say let ants continue running things, they can clearly do the job well. Not perfectly, the world has gone through lots of wars (it would with all the soldier ants), but think of all the incredible things they've done. And bands like The Sex Pistols have the nerve to mock the queen? Well, MAYBE the band members are ants as well. The tragedy is not all ants get along, but on the plus side they do fight each other to the sound of catchy tunes.

Here's a thought: I've discussed the three types of ants and how people could never do anything of note as they're far too simple, so what kind of ants write nicer pieces of music such as The Beatles's 'All you need is love'? I think type D ants. I don't mean to sound pretentious with my apparent discovery, but come on, how can militant and worker ants make something so nice? Unless the queen ant writes such music. There is a band called Queen. THAT'S an interesting thought! Who knew hits like 'Bohemian Rhapsody' were actually written by a literal queen ant?? But ever heard of a queen writing a catchy love song? That's where cat D ants come in. As far as I'm aware the band Queen have written no love songs so there you go. But a queen ant did write Bohemian Rhapsody. I'm sorry for writing a confusing paragraph,

I tried my best. Also, don't you think The Beatles have a funny name? I believe they wanted to call themselves 'The Ants' but thought that was too obvious for a band consisting of ants. Music is a form of creative expression, after all. To sum up, ants are ruling the world and that's fine. I wouldn't recommend wasting your money by studying psychology at university, but at very least it's a super duper easy way of gaining an impressive looking qualification! And bye!
